

Contract for Parking Guide

We propose to develop a parking availability guide for the Innovation Center with the following understandings:

What we propose to make and/or do:

We will design and build a system that estimates parking lot and/or parking spot availability and shares that information with members of the community. The solution may use existing cameras and other available resources to determine whether parking areas are full or have open spaces.

What we need from Company to accomplish this task

Resources required, especially a commitment of contact time for reviews and changes. Some common concerns are: legal help, access to information and photos or photo opportunities for a web site, commitments to maintain a server of some type, and any special hardware or access (like some building for installation).

We will require access to cameras or a couple/ one parking lot cameras, domain/ server to maintain the shared information gained from the project.

Transparency and collaboration. Maintaining a open communication and meetings every so often to refocus as a team. Will help us to be successful, remain on track, and aware of problems/limitations we might face and how we can conquer them as one.

What will happen when these guidelines change

If a requirement becomes unrealistic, unavailable, or technically infeasible, we will notify the client and schedule a discussion to decide on the next steps. Together, we will revise scope and priorities based on what is achievable within course timelines and available resources.

What we expect in compensation

This is a course-based student project. The Company's evaluation and feedback on the work will contribute to roughly 80% of our grade in the Software Engineering course.

What limitations we have

We are a student team completing this work within a course timeline. As a result, the project comes with no guarantees, including warranties, fitness for a particular purpose, or long-term

maintenance/support after the course ends.

Ownership and Fair Use of Intellectual Property

The Intellectual Property created during this project (for example software, business processes, and artwork) is granted permanently for use and extension for the business owner but is ultimately owned by the respective creator(s) who are not limited to reuse or extend this work elsewhere. By the end of this project, a code repository with the software will be made available to the client.

The software may also be used for future demonstrations at Colorado Mesa University.
